Osteoporosis is a condition characterized by a decrease in bone density, which increases the risk of fractures. It affects millions of people worldwide, particularly postmenopausal women and older adults. The condition is caused by a imbalance in the body's ability to maintain bone mass, leading to weakened bones that are more susceptible to fracture. 

The symptoms of osteoporosis may be mild or absent in its early stages, making it difficult to diagnose. However, as the condition progresses, symptoms such as back pain or tenderness in the wrists or hips may develop. If osteoporosis is not treated, it can lead to serious complications, including fractures and the loss of height, which can affect an individual's quality of life.

Prevention is key to managing osteoporosis. This includes maintaining a healthy diet rich in calcium and vitamin D, engaging in regular weight-bearing exercise, and avoiding smoking and excessive alcohol consumption. In some cases, medications may be prescribed to help prevent or slow the progression of osteoporosis.

Treatment options for osteoporosis depend on the severity of the condition and the individual's overall health. They may include lifestyle changes, medication, and, in severe cases, bone-strengthening procedures such as bone grafting or surgery.
After the role for recognition under the French and other national laws and regulations.
